

Team of Email AI Agents

This template provides a **fully automated AI-powered email management system**. It consists of multiple specialized **AI agents**, each designed to handle different types of emails, ensuring fast and structured responses for incoming messages.

Whether you're handling **client inquiries, follow-ups, meeting requests, or support tickets**, this system ensures that every email gets the right response - without manual intervention.

What This Email AI Team Can Do:

- ✔ **Classify and Route Emails:** Automatically detect and categorize emails into **Client Inquiry, Support, Follow-Ups, and Meeting Requests** for efficient processing.
- ✔ **AI-Powered Email Responses:** Generates **professional and personalized replies** based on context.

✓ **Meeting Scheduling:** Suggests time slots and integrates with **Google Calendar** for seamless scheduling.

✓ **Follow-up emails:** Ensures no conversation is lost by **automatically following up** on unanswered messages.

✓ **Support Ticket Management:** Handles **customer complaints, troubleshooting, and issue tracking.**

✓ **Works 24/7:** Never miss a **lead, support request, or business opportunity.**

How It Works (AI Agents in Action)

1. **Supervisor Classifier Agent** – Analyzes incoming emails and assigns them to the correct AI agent based on the type of inquiry.

2. **Support Agent** – Handles **customer support tickets**, troubleshooting requests, and general inquiries.

3. **Meeting Agent** – Schedules and manages **meeting requests**, integrates with **Google Calendar**

and ensures availability before responding.

3. **Client Inquiry Agent** – Engages with potential clients, answering **business inquiries** and providing detailed information.

4. **Follow-Up Agent** – Sends **polite reminders** for emails that require a response, ensuring no conversation gets lost.

5. **Draft & Approval Process** – AI-generated replies are **saved as drafts** in Gmail for **manual review** or **automatically sent** based on your preferences.

Supervisor Classifier Agent (Optional)

The **Supervisor Classifier Agent** is responsible for **email classification** and can be **optimized to run locally** using **DeepSeek R1**.

Save Money: Reduce OpenAI API calls (which are already minimal in this setup) and lower costs over time.

Run Locally: Maintain **control and privacy** over your data by hosting the classification logic in your environment.

LLama Node Integration: To make this work, we will **use a LLama model in the classifier node**, ensuring that the workflow can operate **fully offline or in a hybrid AI setup**.

I will share this integration in different AI Agents templates.

Getting Started:

Step 1: Log in or sign up for **n8n**.

Step 2: Download the **Team of Email AI Agents** template.

Step 3: Import the workflow into **n8n**.

Step 4: Connect your **Gmail, Google Calendar, and OpenAI API**.

Step 5: Customize agent responses to match your **tone and business needs**.

Step 6: (Optional) Integrate **DeepSeek R1 and LLama Node** to **run the workflow locally and minimize OpenAI API calls**.

Step 7: Test, refine, and activate the system.
